

Changing the frame on the MemoryFrame 8000 & 8104

Before trying to place the frame on the unit please read these instructions

Take a moment to examine the unit. On the left side you will see two fixed tabs, these are what will hold the frame in place. On the right side you will see one spring tab. This is what is used to remove and replace the frames.

The spring tab is operated by pulling back on the spring lever on the back of the unit. This allows the spring tab to retract before positioning the frame.

1

Positioning the frame

When fitting the frame make sure the two fixed tabs are positioned to slide into the groove on the wooden picture frame.

Position the frames groove over the fixed lugs

2

Make sure the tabs fit the groove

Make sure the groove sits tightly over the lugs

3

Operating the spring lever

To complete placing the wooden frame onto the unit, pull back on the spring lever as shown below. This allows the spring tab to retract.

4

Fitting the frame

With the spring tab retracted lower the frame onto the unit

5

Placing the frame

Make sure the frame fits snugly before releasing the spring lever. This will allow the spring tab to fit into the groove on the frame.

6

Fitting the frame snugly

The frame should then fit snugly to the unit

7

Removing the frame

Removal and replacement is easy, just pull back on the spring lever to release the frame.
